Hi,

Right, I used an old config.inc file. All issues are solved now.

For not being able to launch project folder in wamp localhost page, it was due to $suppress_localhost in index.php in www folder that must be set to false.

Though, in the Radicore installation page, point 4 : "You will need to change permissions so that the following directories have write access:"
What account must have write access? I finished granting write access to Everyone account...

Ready to Radicore now!

Thanks.
