I think, I understand now what you mean at least I understand (hopefully) the logic. I tried to get it running for me but it seems to be too complex for my skills.

The report consists of several items with up to 10 fields. This would produce 80 multiN lines if no field is empty, isn't it?

I have three output types: 'field', 'image' and 'text'. The output type is declared in the multiN section of the report.inc. But I do not know what output type will be sent for a multiN line. And in the outarray I can only send the value for the output type (i.e. 'field') as far as I can see.

That's why I will create two report versions: a short and a long version in the 'normal' way.

Thanks a lot for your help.
