You are still making the mistake of defining all output elements in a single 'multi1' line. If you look at your output you should see that the images are on their own line, just as the horizontal rule is on its own line. Each line on your output should therefore be defined on its own 'multiN' element, such as 'multi1', 'multi2', 'multi3' etc. I have tried this in my test system, and when there are no images the line is not output at all instead of the being output with blank spaces where the images should be.

What you are trying to do is have a single row of data being split over several lines in the output, which makes it difficult when you want certain elements not to appear at all. You need to output a separate row for each line on the output, and when you want a line to be not printed at all you simply output an empty row for that line.
