I have run RADICORE on several virtual servers without any issues, at least none that couldn't be solved with the help of a debugger.

If you cannot get past the logon screen it sounds like an issue with the session data. The logon screen writes session data which is then read by the next transaction, but if that cannot read the data it jumps back to the logon screen. Without the ability to run a debugger I cannot suggest anywhere else to look at.
