## Hi Tony,

after a popup call in a upd1 pattern the key values are changed. I want to insert the key values from the popup form as a foreign key. In the \_cm\_popupReturn function the key values in the \$fieldarray as well as the values in the \$select\_array are fine. In my debugger I see that when returning the values from \_cm\_getForeignData in std.table.class.inc the key values are changed. Is it because I have the same names as key fields?

I attached the two dict files in the attachment in one file.
