If you installed files from the latest update, version 2.14.0, I accidentally included a copy of my config.inc file which may have overwritten your version. You need to check this file to ensure that it is correct for your server.

That error message is generated in line 1357 of file include.session.inc which says that if the value for $_SERVER['HTTPS'] is true then a value must be supplied for $GLOBALS['https_server']. You need to check the settings in your config.inc file.
