I can handle it now. Thank you.
But $filename = basename($filepath) returns only the name of the picture without the 'picker_subdir'. I do now extend $filename with the value of 'picker_subdir' (pictures/training_uebungen/') manually hardcoded. Even storing the value of 'picker_subdir' in $GLOBALS['picker_subdir'] = 'pictures/training_uebungen' doesn't work. When retreiving it in _cm_popUpReturn() it is empty.
Is there a possibility to get the value of 'picker_subdir'?
