Just some suggestions.

Based on a Role:
Based on a Business Rule:
1. Add features that allow a screen/view to be preconfigured by developer/administrator from a form. Preferably, these properties are stored in database.
example: field visibility, field enabled/disabled.

Currently this is only achievable through scripting in the classes. This can be very tedious if too many rules.

Would be good if business rules can be factored out and stored in database as well. Similar to BPM workflows.
