I have up to 10 levels. The first 5 levels are stored in one table so that should be no problem.

According to your Bill Of Material, every table should have a coloumn node_id if an occurrence is a leaf in the tree and additionally a coloumn node_id_snr if this occurrence can be a node as well, isn't it?

I will start as you recommended with my structure diagram and try to implement the tree structure level by level from top to bottom. An advantage should be that the structure doesn't necessarily has to be as flexible as you described it in the tutorial. So I hope I will get it done.
