Thanks,

Those functions are what I was looking for. But where in the table class would I call them?

Basically, I want to set the combination of 5 boolean fields to a certain state depending on which of the 3 tasks was called for all records selected in the previous screen.

Now the second problem, is how would I provide a popup within this sequence, to allow the user to pick the content for one field from a dropdown keyed from another table?

The UPD4 is one of a few, that does not have examples I can find anywhere on either site.

Thanks,
Dan
