Hi Tony,

Yes, I looked through what you mentioned, but have a few questions.

You say to use the _cm_changeConfig function. What would be needed to list the other table(destination) as a drop down within the table(sources). What I have so far is:

```
 $this->fieldspec['table_id_snr']['control']       = 'popup';
 $this->fieldspec['table_id_snr']['task_id']       = 'destination(popup)snr';
 $this->fieldspec['table_id_snr']['foreign_field'] = 'table_id_snr';  <===== should this be the field ID from the destination table?
 unset($this->fieldspec['table_id_snr']['noedit']);
 return $fieldarray;
```

Is that what you were referring to?

Then, how would would I access that data within the call to update4? You mention _cm_getPkeyNames, but how would that work, when the current value of the destination key field in the files table is NULL?

I looked for example in some of the other code, but not sure if I have the correct idea here.

Thanks,

Dan
