Hi,

Just a small thing.

Is it possible to add the radicore version to the loginscreen?
I do this now by adding the following lines to the file
radicore/menu/logon_footer.txt

<p/>
Radicore Version 1.17.0

I could not find another way to check whcih version is running on which system.

Greetings

Interesting idea. I'll think about the various ways it can be done and put it in the next release.

Attached is an update for you to try out.

Instead of just displaying a single version number on the logon screen I am allowing each subsystem to display its own independent version number. Just create a file called 'version.txt' in your subsystem's main directory, and whatever text it contains (up to 20 characters) will be displayed at the bottom of every screen within that subsystem.

Try it out and tell me what you think.

Just intalled it, and find it great.

Before upgrade jsut a liitle note.

The dict_table(generate)[ab] tasks :
Is it on purposse they are not in the menu yet ? I added the first task to the table(list) and it seems to work.

(I changed the pattern for the script id to table.action.php instead table(action).php.)

Thanks

johan

Whoops. I forgot to include in the upgrade notes that the contents of file radicore/dict/sql/dict.menu_export.sql needs to be imported.

It is working now.

I was looking for the "generate php" in the table list screen instead of the table read screen.

I should have read the tutorial sooner. It is well documented in there.

Again thanks

Johan

The reason I did not put it in the table(list) screen is that it will not work properly with multiple selections, so I put it in the table(enq) screen where it only has to work with the current selection.
