Hi,

Included a patch file and some explanation to solve the subject.

The patch is against V19.0.

This code is currently working against our corporate active directory.

I hope I achieve this with as less as possible modification of the framework itself, but still be able to support any custom authentication method.

I hope you will find this useful

Detailed explanation is in the archive

In the archive you will find :

radicore_authentication.patch

Radicore_auth.text

Greetings

johan

Hi,

Just a little wake up call.

Got any time yet ?

Greetz

I can't test it because I don't have an LDAP server, and if I can't test it I can't implement it.

I also cannot see the point of validating against an LDAP server if the user already has a record on MNU_USER as the existence of a record on MNU_USER already indicates that the user is valid. So, validating against MNU_USER and then an LDAP seems redundant to me.

Hi,

No problem.

When I start PHP development again, I will try to defend this case.

Thx for your time

Johan

The option of authentication against an LDAP server will be available in version 1.40.0

This is documented in FAQ114.
