is "includes/config.inc.default" supposed to be renamed to
"includes/config.inc"
because if I do, I get an error:-
This application has encountered an unrecoverable error

The following has been reported to the administrator:
2006-12-20 09:20:49

Fatal Error: Object of class mysql could not be converted to string (# 4096).

Error in line 47 of file '/opt/lampp/htdocs/xampp/Radicore/includes/dml.mysqli.class. inc'.

Script: /xampp/Radicore/menu/logon.php

Remote Address: 192.168.1.12

Request URI: /xampp/Radicore/menu/logon.php

Yes, you have to rename config.inc.default to config.inc just as the installation instructions say. You also have to amend this file to include your username and password for the database connection. If you do not follow these instructions then the application will abort when it attempts to connect to the database.

Attached are some updated files which should replace the "Object of class mysql could not be converted to string" message with the correct error message.

Did all that, ne error :=

Catchable fatal error: Object of class mysql could not be converted to string in
/opt/lampp/htdocs/xampp/Radicore/includes/error.inc on line 223

which is in the print_Trace function

the line is $result .= $indent ."$level2: " .gettype($string2) ." = $string2\n";

Let me take a guess and say that you are using PHP version 5.2? If so this is a new type of error that did not appear before. I won't upgrade to 5.2 until Zend issue a version of their deugger that works with 5.2, so I cannot reproduce this error on my PC.

I suggest you comment out that line and see what happens.

Result of FUNCTION GUESS = TRUE

'nother new error when commented out the line & 'nother error :-

This application has encountered an unrecoverable error

The following has been reported to the administrator:
2006-12-20 15:45:38

Fatal Error: SQL (# 256).

Error in line 47 of file '/opt/lampp/htdocs/xampp/Radicore/includes/dml.mysqli.class. inc'.

Script: /xampp/Radicore/menu/logon.php

Remote Address: 192.168.1.12

Request URI: /xampp/Radicore/menu/logon.php

which is in the mysql class constructor

any ideas?

Line 47 is where the constructor attempts to connect to the database, so the connection is failing. Either the database does not exist, ot the username and password are invalid.

To see the inital connection error can you insert "echo $errstr;" after "$save_errstr = $errstr;" at line 37 of includes/error.inc and try again.

No such line in error.inc - can't find a $save anywhere in that file, so I put it at the start of the function.
Yep - username/password issue.
Changed the config.inc file and ..
it works on local machine, but not over the network.

Once I log in (from the PHP login screen, I just get loads of warnings about date()[function.date] and nothing else

date() [function.date]: It is not safe to rely on the system's timezone settings. Please use the date.timezone setting, the TZ environment variable or the date_default_timezone_set() function. In case you used any of those methods and you are still getting this warning, you most likely misspelled the timezone identifier. We selected 'UTC' for 'GMT/0.0/no DST' instead

Try the version of include.inc in the attached zip file instead.

Do you have a timezone set in your php.ini file?

There wasn't an include.inc in the zip file

anyway
put the line date.timezone="Europe/London" in php.ini file, tah stopped the timezone errors.
Thanks

Getting other errors now when I click on the menu entries. Going to give up with Linux - there's too much I don't know.. will switch back to Windoze

Andy

had to add "HTdocs/Radicore/dict" to the htaccess file

now everything is working.....

They would complain a lot more if there wasn't one!
