Just running through the tutorial on the web site - got as far as:-

Now that a many/child/junior table has been specified this will allow the foreign key field(s) on the junior table to be linked with the corresponding primary key field(s) on the senior table. In this case the value 'option_id' should be selected from the dropdown list for 'Column ID (jnr)'. By pressing the Submit+next' button these details will be added to the database, and control will be passed back to the screen shown in Figure 14:

The drop-down list box is empty.....

Have you imported the columns for the child table? The dropdown list is populated from the contents of the data dictionary, so if the dictionary has no columns for that table there is nothing to put in the list.

If you are trying to create a relationship between table 'A' and table 'B' then you have to import the details of both tables into the data dictionary.
