Subject: Fatal Error after login

I've installed radicore on opensuse 10.2. Once I login with mgr, I get the message below. Reading through some of the messages, I noticed that the include_path was often a problem, so I double checked it to make sure it contained include, menu, audit, workflow.

So it looks like I blew something on the install. Can anyone point me in the right direction.

Thanks
Bob

Fatal Error: pg_query(): Query failed: ERROR: 42601: syntax error at or near "****" at character 119 LOCATION: yyerror, scan.l:770 (# 256).

SQL query: SELECT count(*) FROM wf_workitem LEFT JOIN wf_workflow ON (wf_workflow.workflow_id=wf_workitem.workflow_id) LEFT JOIN ****menu.mnu_task ON (mnu_task.task_id=wf_workitem.task_id) WHERE wf_workitem.role_id='GLOBAL' AND wf_workitem.user_id IS NULL AND wf_workitem.workitem_status='EN' AND wf_workitem.transition_trigger='USER'

Check the setting for $dbprefix in the config.inc file. It is set to "****" by default, but you must change it to suit your particular installation.
