Sir,
I have many fields in the data entry form that the user has to be fed. While entring these fields, some others such as tax (5% of the amount column), welfare fund (2% of the amount column) netAmount (Amount+Tax+welfareFund) etc have to be displayed in the corresponding textboxes provided automatically. How can it be possible. Can you give me some examples?
Yours sincerely
Douglas D'Silva.

The contents of an HTML form cannot be changed while the user is inputting data without using some client-side scripting such as javascript. With standard HTML the form contents are constructed on the server and sent to the client in response to a request. The form contents cannot therefore be changed without sending another request to the server and receiving another response.

I do not use any javascript in Radicore, but there are facilities which allow to to include javascript in the HTML output - take a look at http://www.tonymarston.net/php-mysql/radicore-and-javascript.html for details.
