I have a few many-to-many relationships defined as follows:

employee -> employee_address <- address
company -> company_address <- address
contact -> contact_address <- address

Displaying this information with list2 is not a problem but adding a new address to an employee, company, or contact is cumbersome because the address table contains approximately 5000 rows.

Is there a way to make this situation easier within the framework or possibly a better schema design?

In the framework I have two examples of many-to-many relationships, with 3 different ways of maintaining them. Go to List Task (Proc) and check out Maintain Navigation Buttons 1, 2 and 3, and also List Task (Menu) and Menu Items 1, 2 and 3. Just play with them then pick the flavour that you like the best.
