Dear Tony,

I'm trying to install radicore on a godaddy virtual server.
I've changed the php.ini in order to get there xsl and all the issues detailed on the default .htaccess file which comes with radicore.
After a few try and error tests I got to run logon screen; but when write user and password nothing happens, not even an error; the screen is submitted and then the form is loaded again with blanks input fields.
Do you have any idea why radicore could run this way? I can't debbug on this server.

Thanks for advance for your oppinion.

I have run RADICORE on several virtual servers without any issues, at least none that couldn't be solved with the help of a debugger.

If you cannot get past the logon screen it sounds like an issue with the session data. The logon screen writes session data which is then read by the next transaction, but if that cannot read the data it jumps back to the logon screen. Without the ability to run a debugger I cannot suggest anywhere else to look at.
