Subject: How to display child records

My database has Grants (research studies) with associated Staff...one-to-many relationship. I can list my Grants using a List1 pattern (all ok).

Desired behavior: Put a button on the Navigation bar "Staff" that, when selected will list all the staff for the selected grant.

I setup the relations from Grants to Grant_Staff and generated a List2 task on the Grant_Staff table with links to Grants. I think this should list the staff I want. I now have a task with the ID "div_grant_staff(list2)". How do I get this on the Navigation Bar when displaying the list of Grants (task name for this is "div_grants(list1)"?

Am I approaching this correctly?

Thanks Tony. I guess I never followed all the links at the end of each tutorial (I had only seen #1 and #2). Your system works exactly as described. The tutorials are well laid out.

I am continuing deeper into the maze....
