This version contains the following updates:

fixed bug which caused message produced by 'Recover Password' task to be lost when returning to the logon page when it is displayed using the HTTPS protocol.
fixed bug which allowed invalid characters in user passwords to be allowed if they were not encrypted. This caused a problem when using the Control screen to set all passwords from unencrypted to encrypted as this processing would fail if it hit a password which contained invalid characters.
PDF library changed from http://www.fpdf.org/ to http://tcpdf.sourceforge.net/ as this includes support for UTF-8 unicode fonts and barcode generation.
fixed bug in $where string processing (converting from string to array and back again) which caused problems when the leading characters of a string field contained relative operators such as '<', '>', '<=', '>=', etc.

For details on the new barcode generation facility please refer to
http://www.tonymarston.net/php-mysql/output-to-pdf.html#barc ode.generation.
