This version contains a few enhancements and bug fixes.

made it possible to include '../menu/logon.php' from another script in order to allow additional logon screens for different purposes. Each logon can have its own footer.txt and CSS entries.
modified LIST2, LIST3, MULTI2, MULTI3 and MULTI4 controllers so that the contents of 'Selection (fixed)' from the MNU_TASK table is made available in $this->sql_where for all middle and inner entities. This is because the value may get filtered out when the $where string is extracted from the previous entity.
modified the _sqlAssembleWhere() method in 'std.table.class.inc' so that if the WHERE string contains a reference to a name which appears as an alias name in the select list (i.e: 'name AS alias') it will be moved to the HAVING string, thus avoiding an SQL error. This makes the solution in FAQ 85 obsolete.
modified the mechanism by which primary keys are extracted from one object for passing to another object, either within the same task or a different (child) task. By default only the fields which are part of the primary key will be included in the $where string, but this list can be altered at runtime within the _cm_getPkeyNames() method.
modified the mechanism by which the $where string which is passed down from the previous object, either within the same task or a different (parent) task, is filtered during the initialise() method. By default any field which does not exist in the $fieldspec array will be filtered out, but additional fields can be added to list within the _cm_filterWhere() method.
fixed bug in dict_database(import) which failed to deal correctly with a non-null value in $GLOBALS['dbprefix'].
added the ability to change the hyperlinks above the menu bar from text to images. Refer to FAQ 99 for details.
added 'Search' navigation buttons to the various 'mnu_initial_value_role/user' tasks. Please run script radicore\menu\sql\menu.menu_export(2008-02-07).sql to import these changes.
modified structure of USER and TASK_FIELD tables in the MENU database. You will need to run script radicore\menu\sql\mysql\alter_table(2008-02-27).sql to modify your existing database.
