Installed ver 1.34 and when I started to run it after finishing the usual setting up, I got this error message.  include.session.inc has the function and it appears that its properly included....

Fatal error: Call to undefined function getsupportedlanguages() in E:\xampp\htdocs\radicore\menu\logon.php on line 109

Any ideas?

The function getSupportedLanguages() is defined in file 'include.session.inc' which is referenced from 'include.general.inc' with the following code at line 3363:

```
if (isset($_SERVER['SERVER_PROTOCOL'])) {
    $protocol = 'HTTP://';
    require_once 'include.jump.inc';
    require_once 'include.session.inc';
} else {
    // this is being run in batch/cli mode, not from a web server
    $protocol = '';
} // if
```

As you can see the only way for this file not to be included is if $_SERVER['SERVER_PROTOCOL'] is not being set by your web server. Can you check this out by running phpinfo(), or by stepping through with your debugger?

REMOTE_PORT  1275
GATEWAY_INTERFACE  CGI/1.1
SERVER_PROTOCOL  HTTP/1.1
REQUEST_METHOD  GET
QUERY_STRING  no value

phpinfo() displayed this.  Do I take it that SERVER_PROTOCOL is set as HTTP/1.1?

Sorry if I am not so versed with this.  Thanks for the patience.

Yes, the value "HTTP/1.1" is correct. This would imply that the file 'include.session.inc' is being included at runtime, in which case the function 'getSupportedLanguages()' is being defined and therefore should be found.

Can you step through with your debugger to double check that the file is in fact being included correctly?

sincere apologies. it was a careless mistake. I failed to adjust the php.ini for include_path and instead it was getting includes from the previous version's path.  Thanks

I'm glad you got it sorted out.
