This version contains the following bug fixes and improvements:

changed the PostgreSQL driver (dml.pgsql.class.inc) to use pg_escape_string() instead of addslashes() following the advice given with the release of version 8.1.4
changed the Mysql drivers (dml.mysql.class.inc and dml.mysqli.class.inc) to use SQL_CALC_FOUND_ROWS and FOUND_ROWS() to obtain row count. This fixes a problem using SELECT count(*) with a GROUP BY clause.
updated file include.xml.php5.inc to include the align_hv/align_lr specifications for radio groups and the align_lr specification for checkboxes.
updated various xsl stylesheets and templates to use the variable 'zone' instead of 'table' to be consistent with the documentation.
changed std.validation.class.inc to use the default value (if it has been defined) when no value has been supplied, even when the field is not marked as "required".
changed std.datevalidation.class.inc to deal with a choice of 'dmy', 'mdy' and 'ymd' date formats. The choice can be set in $GLOBALS['date_format'] in the CONFIG.INC file. Will default to 'dmy' if not specified.
fixed bug in audit_dtl_list3.php which prevented the message "No parent has been selected yet" from being displayed when no parent had been selected.
created directory CSS to hold a series of css files (which makes 'radicore/style_default.css' redundant), and modified mnu_session_upd.php to allow the user to choose one. This choice will be stored in a cookie so that it persists beyond the current session.
moved all individual 'radicore/<subsys>/images' subdirectories into a single 'radicore/images' directory.
changed the images, css files and xsl files which deal with tree structures to improve the screen display.
