Hi Tony,

I have a new laptop running WIN 10 and want to move my radicore application. I installed xampp 5.6, copied all files and changed the various path variables.

Now I get an unrecoverable error when trying to start radicore. You can see the screen shot in the attached picture.

Do I have to change the mailserver entries in php.ini? Or do I have to change entries in my config.inc?

Best regards,

Juergen

This error has two parts:

1. You have not enabled the XSL extension in your PHP installation. That is why it says "XSL functions are not available".
2. You change the mailserver entries in your php.ini file.

Thank you. Just deleting the semi-colon in the windows section in front of "extension=php_xsl.dll" in the php.ini file helped.

I wish all problems could be solved as easily!
