Subject: DEL1 - Exception

Hi Tony,

I have a strange behavior in one of my del1 pattern. There is always an exception saying that there is a unknown database. I attached the errorlog.htm. I checked the tables in dict (dict_table, dict_table_key, dict_column, dict_related_column). The fields, the relationships and the key are fine. It is just this pattern of this table. I used to have this behavior and after I exported the tables in php again, everything worked fine again.

Have you any idea where I can look for my fault?

Does this error with the DEL1 pattern only occur with this one table?

Can you send me the class.inc and dict.inc files for this table so that I can take a look?

The table class has the value 'unknown' loaded into $this->dbname in the abstract class by default, but this SHOULD be replaced with a valid dbname in the class constructor when it sets values into $this->dbname and $this->tablename before it calls $this->getFieldSpec_original();

Can you check the class constructor to see if it is doing what it is supposed to do? Can you check that this constructor is being called?

Yes, this happens only with this table.

As far as I see, the class constructor is working fine and the $fieldspec will be loaded successfully. In the further course of the validation checks the tablename gets lost.

I attached the class and the dict file.

I cannot see anything in those scripts which would change the value in $this->dbname.

You will need to step through the code with your debugger to see where the contents of $this->dbname changes.

What exactly is your issue? What are the details? Have you investigated using your debugger?
