
Subject: getData_raw is calling post data processing

After a long break I am upgrading my RADICORE system to the latest version as my old config is going EOL.

I have come across a problem where my code no longer works in the latest radicore version and after debugging I have found that when I call getData_raw from within _cm_post_getData() I end up in a loop inside _cm_post_getData().

The debugger shows a reference to \$control_flags['rdc_no_post_getdata'] in std.table.class.inc which is not set so the code continually loops on line 4476 into custom_post_getdata rather than skipping.

Is this a bug, or is there somewhere that I now need to set the rdc_no_post_getdata control flag? I couldn't find anything in the documentation about it.

Many thanks,

Graham

My apologies. I have updated the documentation.

Thanks Tony.

How do I set this flag if I want to call getData_raw() without any post processing?

Simply add "rdc_no_post_getdata=true" to the WHERE string. This will be extracted into the \$control_flags variable in line 4412 of the getData_raw() method, and then acted upon in line 4493.

That hasn't worked for me Tony. My code is

```
// If the number of rows retrieved is more than the maximum
sequence number then don't display some of the output task buttons
$exammax =& RDCsingleton::getInstance('exam');
$exammax->sql_select = "MAX(exam_seq_nbr) as maxseq";
$exammax->sql_where = "rdc_no_post_getdata=true";
$max_seq = $exammax->getData_raw($where);
```

and this has generated the following error:

Fatal Error: MySQL: Unknown column 'rdc_no_post_getdata' in 'where clause' (# 1054)
SQL query: SELECT MAX(exam_seq_nbr) as maxseq FROM exam WHERE rdcaccount_id='6'
AND session_id='37' AND rdc_no_post_getdata=true
Error in line 1046 of file '/var/www/medaltest.com/includes/dml.mysql.class.inc'.

I'll step through with my debugger and see if I can find out what happened.

However, I noted that the line numbers you quoted don't seem to match with what I'm seeing in std.table.class.inc. The header in that file is dated 14/11/24 and says revision 52.

Ah, I see now that I need to append the control flag to \$where itself, and not object->sql_where

It works now that I've corrected that.

Maybe an example in the documentation might be useful for others as these control flags aren't documented.

Thanks for your help Tony

I have added What are Control Flags to the FAQ.
