Subject: How to make enquire 1 show child records in many to many relationship

I have three tables:
team
player
team_player_xref (as one player can play in many teams)

I'd like to know if it's possible that when the user clicks the 'read' button on a list 1 transaction for table 'teams', it displays all the players in that team.

I use a link 1 for adding players.

I've tried a list 2 transaction, but then it only shows the data of team_player_xref which is basically a team_id and a player_id.

Any ideas?

If you are in a LIST1 transaction for table 'team', and you want a navigation button which will show all players within that team, then you must construct a LIST2 transaction which has 'team' as the outer entity and 'team_player_xref' as the inner entity. If you have defined a relationship between 'team_player_xref' and 'player' then you can automatically JOIN to the 'player' table to obtain the player's name.

Look in the Example application at 'List Option for a Selected Person' for a working example.
