Subject: Selecting specific databases instead of all.

I'm trying for the first time Radicore. It's a wonderful platform.

But when I was importing the database to the Dictionary, all of the databases in my mysql server were imported. I have over 50 different databases and I only need to import one... So I have to delete all 49. And this will happen every time I need to import a database.

My suggestion is: before the import take place, maybe have an option that ask if you want to import all databases or permits enter the name of a specific database.

Good point. I'll put that on my 'to-do' list.

Update: this enhancement is now incorporated in version 1.10.0
