Subject: _cm_popupcall giving unexplained result

I'm trying to filter the results of a popup by modifying the where string in _cm_popupcall to join to additional tables using a foriegn key selected fom a dropdown.

This was working fine until I changed my datamodel. I've added a third table through an additional join in the where. The SQL is correct, but the popup is now retrieving all rows from the target table.

The relationships are all defined correctly - so is there something else that might override the $where in _cm_popupcall?

You cannot use _cm_popupCall() to specify any joins to any database tables. All you can do is modify the $where string which is passed to the popup. Any joins must therefore be done within the popup and not the task which calls the popup.

Thanks - that's fixed it once again!
