Subject: Condition in $where string is being lost

I'm trying this approach with a league and assigning teams to it. I'm changing the where clause in the child subclass so that it displays teams with grucomp_id=NULL, the code is the following:

```
// ***************************************************************************
function _cm_pre_getData ($where, $where_array, $fieldarray=null)

{

$where = "equipo.grucomp_id IS NULL AND grucomp.liga_id in
(SELECT liga.liga_id FROM liga WHERE liga.deporte_id=equipo.deporte_id AND
liga.categoria_id =
equipo.categoria_id AND liga.temporada_id = equipo.temporada_id)";

    return $where;

} // _cm_pre_getData
```

By debugging the sql file I see that the where clause is equipo.grucomp_id IS NULL and that all the other conditions in the clause are erased.
Any tips to where the where clause removes the last part of the conditions I add?

If you stepped through with your debugger you would see that the second condition is being lost inside the _sqlAssembleWhere() method during the processing of the filterWhere() function. Try moving that condition to $this->sql_where instead as this is not affected by that function.
