Q: I see that when creating a new subsytem I copy and paste contents of the default folder. This folder includes component files (such as list1.php, not sure if component is the right term) albeit without "std.", is this to allow customization?

And is it required? If I don't plan to have anything different in my list1 can I delete the list1.php?

They are sample scripts for each of the transaction patterns. You can delete them (anything that ends in a number before the .php) if you want. Everything else should be left as it may need to be customised.

When you create scripts for each of your components each name should be a combination of the table name and the pattern, as shown in all the other subdirectories.

As of version 1.17.0 which was released in October 2006 there is a "Build Directory" option on the "Subsystem" screen which will create the initial directory for a subsystem, then copy across all the necessary files from the "default" directory, so it is no longer necessary to do this manually.
