In FAQ 109 you describe how screen column headings can be changed dynamically. Can the same type of functionality be reproduced for report column headings?

The contents of the report structure file is read into $GLOBALS['report_structure'] at the start of the script, and this can be modified within any table class before it is processed. There are no purpose-built functions for this as yet.

Can't get this to work. I'm trying to modify column headings within _cm_pre_output() for the class being printed by setting $GLOBALS['report_structure']['body']['fields'][n] but the values set in the report structure file are still being printed.

Could you provide some further pointers please?

Thanks,

Graham

After looking at the code I see that the contents of $GLOBALS['report_structure'] is moved to $this->structure when the PDF class is instantiated.

Still not getting this to work, Tony. Whatever I change in either $this->report_structure or $this->structure is not getting through to the output document.

Try this update to version 1.42.0 which contains a new function called 'replaceReportHeadings($replace)' where $replace is an associative array. This in the format 'fieldname' => 'newlabel'. The function will examine the report structure file and where it finds 'fieldname' it will replace the existing label with 'newlabel'.

(attachment deleted, replaced in later post)

Well it does work except for a small error on your part! Lines 3107 and 3108 in include.general.inc refer to $screen_structure instead of $report_structure. I've changed that in my copy and it works great.

Thank You

Whoops! That's what happens when you test the code and then "improve" it.

Here is a corrected version of that update.
