Subject: XSL - Client side vs. Server - control

Q: I've found that using Opera 9 the Client side XSL sometimes crashes. Of course, Op9 is not a popular browser but I'd like to support as many browser as possible.

Thus, I'm wondering how to set XSLT process to run on the server. For some reason I thought there was a TTW (web) way to set this, but now I can't find this setting... if it does indeed exist.

go Germany!

There is a setting called $GLOBALS['XSLT_client_side'] in the CONFIG.INC file which can be used for all sessions.

Alternatively you can append the argument 'csxslt=on' or 'csxlt=off' to any query string to switch it either ON or OFF, even in the middle of a session.
