Subject: Problem when ListView Total causes new page

I've discovered a problem with variables in the title sections of a report when using _cm_ListView_total() to print totals at the end of a report.
The problem occurs when the number of items in the report causes a page to be thrown at the point the totals are to be printed. The totals are then the only items on the final page (no problem with that), but the variables in the titles are printed as variable names (e.g. %%date) instead of the variable value. On all previous pages the variable values are printed correctly.

Regards,

Graham

Unfortunately this does not seem to have made any difference. The problem is still occurring.

My apologies for the confusion. The fix DOES work. I placed the new file in the wrong folder by mistake so was still running with the old include file.

Thanks for the fix.

Graham

It works for me. I ran a test using the EXAMPLE subsystem. I changed line #16 in file xample/reports/en/x_person.list.report.inc from

$structure['title'][] = array('text' => '- Contents of X_PERSON table -',
 to
$structure['title'][] = array('text' => '%%last_name',

and when I select 26 entries before pressing the 'Output to PDF(L)' button I see the value of last_name from the last record shown in the title, not the string '%%last_name'.
