I've noticed that since the latest upgrade creating a hosting account now sets the rdcaccount_id to the value 1 when creating a new account.

Whoops! Somehow the menu-data.sql script was built without the following entry:

REPLACE INTO `mnu_account` (`rdcaccount_id`, `account_name`, `rdcversion`, `created_date`, `created_user`, `revised_date`, `revised_user`)
VALUES(1, 'Shared Account', 1, '2007-09-13 11:41:52', 'AJM', NULL, NULL);

This should create the 'shared' account with the id of 1, with all new records having a id greater than 1.

Empty your version of mnu_account, run this sql statement to create the first record, then you can create any new accounts.

I shall update my sql scripts for the next release.

This doesn't seem to be the cause of the problem.

Having done that, when I try to add a new account I get the message Quote:[rdcaccount_id] A record already exists with this ID.

This suggests that the system is always tring to with rdcaccount_id = 1.

Graham

I don't know where that bug came from, but here's the fix.

Well...
That fixes the problem of being able to create a new hosting account. However, I'm afraid I've discovered another problem now:
I created a new account to test the fix, and find that now it cannot be deleted. The delete dialog runs ok, but on pressing submit you are returned to the list screen and the account has not been deleted.

I think these bugs were introduced a couple of versions ago actually. I found a backup of std.table.class.inc dated April, and the code in this area is slightly different.

Silly me! I forgot about deleting an account, so here's another fix.

Thanks for the fix.

Actually Tony - you forgot updateRecord too. I've already corrected my version now.

Graham
