Subject: Use of $this->skip_validation

I am trying to update a record and skip the associated validation as per the documentation. However, I've found that _cm_post_updateRecord() is being executed on line 4598 of std.table.class.inc even though $this->skip_validation is set.

Is this a bug or have I misunderstood the processing somewhere?

Graham

Unfortunately the documentation is slighty out of date as a call to _cm_post_updateRecord() will still be made. This is because I came across a set of circumstances where I wanted to skip the validation but NOT the post-update processing.

If you want the code inside_cm_post_updateRecord() to be ignored then you will have to test the contents of $this->skip_validation yourself.
