Subject: Patch for version 1.54.0

A small change I made to the generic table class for a new script I was working on was found to break other scripts, so I have had to reverse it.

It only affects those table classes which have code in the _cm_post_updateRecord() method which compares the contents of $rowdata and $old_data to see if a particular value has changed.

My apologies if this has caused any inconvenience.
