This version contains the following changes:

fixed bug in startTransaction() method within 'std.table.class.inc' so that, when setting up the lock array, if the multiple database server option is employed it will use a separate dbprefix for each server rather than a single dbprefix for all servers.
modified the '_cm_ListView_print_after()' method within 'std.table.class.inc' so that it includes $next_row as the second argument. This will allow a comparison to be made with the current row before printing any extra lines.
fixed bug in processing of MULTI4 pattern which failed to associate error messages with the correct rows of the inner entity.
modified screen structure files to allow the 'align' and 'valign' attributes to be specified for cells in the vertical view.
modified 'std.multi1.inc' so that it calls the 'validateDelete()' method before the 'deleteRecord()' method.
modified 'update column' in the data dictionary to allow a new control called 'image hyperlink'. The field value should be the path to an image, and this will be displayed as a thumbnail image which will also be a hyperlink to the full-sized image.
