Subject: Update from a Detail Screen works incorrectly

Hi,

When using Dictionary system from:

Breadcrumb: HomeÂ»DictÂ»DatabasesÂ»Tables
Script: radicore/dict/table(list2).php

If I select multiple tables and press "Read" I get a screen with the details for the tables and I get a pagination bar. When I am on record 1 of 3 and click "Generate PHP" things work as expected. When on record 2 or 3 of 3 and I click "Generate PHP" the subsequent screen shows the detail information for record 1 of 3.

It looks like the active pagination data is not being passed down to the script/task.

I've seen this before but this is the only reproducible instance I have seen.

Cheers,

Kyle Brost

I found this problem myself a short while ago. I fixed it by modifying the getWhere() method inside 'std.table.class.inc' (see attached file). Let me know if this fixes it for you.
