Hello sir

Could you give me good example of pre_delete record function

How useful would an example be? You can put inside this method any code you want executed before you delete a record.

What are you trying to do?

Hello sir ,
If I have to delete a record of mother table,first i want to delete a record of mother table.so I thought pre_delete_record is good for that one.Am i right or wrong?

If you are trying to delete a record from table 'A', but at the same time you wish to delete any associated records from table 'B', then you can achieve this automatically by creating a relationship between table 'A' (the parent) and table 'B' (the child) and setting the relationship type to 'CASCADE'. This is documented in dict_related_column(multi4).
