This version contains the following changes:

fixed bug in 'std.pdf.class.inc' when a report line has both text and a barcode, and the height of the barcode is not an exact multiple of the line height of the text.
updated 'std.pdf.class.inc' to include the following:
allow margin and padding options to be supplied either with or without an underscore making 'marginleft' and 'margin_left' both valid.
restrict the 'border' option on barcodes to the containing cell and 'image_border' for the barcode itself (when the barcode is smaller than its cell).
removed the 'position' option on barcodes as this positions the cell within the page, not the barcode within the cell.
added the 'cellfitalign' option to barcodes to position the barcode within its cell.
added the ability to handle 2D barcodes (QRCODE and PDF417).
added the 'margin_top' and 'margin_bottom' options to the page definitions.
added the 'image_offset' option for pictures and barcodes to provide a space between the image border and the cell border.
added the 'body_gap' option to specify a gap between the header and the body. The default is 1mm.
allow width of '*' to be used on more than 1 column, in which case the remaining space will be apportioned equally.
