Thank you sharing such unique and amazing framework!

Followed and completed the tutorial all the way to Part 4, Figure 6 - list X_TREE_NODE (jnr) screen (original).

Got exactly same result as in Figure 6. But isn't this result wrong as the jnr tree nodes list just shows the snr tree node record?

By following the subsequent chapter "4. Modify the screen structure file" I am able to customize the screen but not able to get results like in Figure 7 and Figure 8, cause the jnr tree nodes listed is just the same as the snr tree node record, just like in Figure 6.

Figure 6 shows the same record in both the SNR (upper) and JNR (lower) areas as both of them are reading the database with the same WHERE clause:
WHERE node_id='1'

When you make the modifications shown in Modify subclass x_tree_node_jnr this will change the JNR class to produce the following WHERE node_id_snr-='1'

This is not very clear, so I shall amend the tutorial.
