```
// create initial entries on PLACE table
   require_once 'classes/wf_place.class.inc';
   $dbobject =& RDCsingleton::getInstance('wf_place');

   // create entry for START place
   $place_array[0]['workflow_id'] = $rowdata['workflow_id'];
   $place_array[0]['place_id']    = 1;
   $place_array[0]['place_name']  = 'START';
   $place_array[0]['place_type']  = '1';

   // create entry for END place
   $place_array[1]['workflow_id'] = $rowdata['workflow_id'];
   $place_array[1]['place_id']    = 2;
   $place_array[1]['place_name']  = 'END';
   $place_array[1]['place_type']  = '9';

   $place_array = $dbobject->insertMultiple($place_array);
   if ($dbobject->errors) {
      $this->errors = $dbobject->errors;
   } // if

   return $rowdata;
```

I want to get parent data automatic into child table, i don't know which function exact to use. So I use the function above
But I don't get useful result. Can someone give me some advise?

"I don't get a useful result" is not much of a description. What result are you getting? What are you expecting?

You have to ccpy the data manually from the parent to each child.

You still have not described the exact nature of the problem, so it is impossible for me to advise on a solution.
