Subject: Multi Dropdown field on list2 screen

I have just introduced a multidropdown field following the instructions in FAQ59 (and FAQ9). On my detail screen this works perfectly, and I can update the multiple rows in the dropdown and save the correct results in the database. However, when I display the field on a list screen, every row shows the sum of all the fields selected on each entry.

E.g. if on the detail screen record 1 has selected A,B and record 2 has selected B,C then on the list screen both records show A,B,B,C in the field.

There is a working example of a multi-dropdown in the PERSON screen of the EXAMPLE subsystem in the PROTO menu, and that works as it should. Perhaps you should examine the code to see if you can spot any differences with your code.
