Dear Sir,
I created a task, when trying to modify the parameter initial_passthru of it, the menu system came down, find attached a PDF file with error

File Attachments
1) Error Radicore.pdf, downloaded 1465 times

The error is caused by the fact that the value 'pro_product_codes(search)' is not enclosed with single quotes in the generated query. The only time this can happen is if your code contains the following somewhere:

$this->allow_db_function[] = 'initial_passthru';

This causes the DML object to treat the value as if it were a function call, as in 'function(args)', instead of a literal value. REmove this offending line and your problem will disappear.

The only time you should EVER populate $this->allow_db_function is when you KNOW that the value you are supplying is a function call and not a literal.

Thanks for your answer.
I haven't touched the menu system code, and the "pro_product_codes(search)" transaction as the transaction wich should do the "initial_passthru" are the original generated by the framework. Is there anything else I should check?

You will need to use your debugger to step through the updateRecord() method inside 'dml.mysqli.class.inc' where it generates the SQL query.
