Subject: multi-selects with dropdown

Q: I have a situation where it is desired to search multiple items from a single dropdown list.

Ex. If we have 10 depts, user may want to see reports from 3 of the departments. Currently, it seems that dropdowns don't support the "multiple" HTML attribute. Is this correct? Or is there a way?

Of course, the other side of this equation is if the SQL parsing knows to make this an "OR" type search on a single column. Ex. " (Dept=1 OR dept=2) " etc.

regards,
andy koch

You are correct. The framework does not support multiple selects at present, so I'll see if I can make it available in the next release.

Multi-select dropdowns are now fully supported in RADICORE v1.13.0

I have built a sample into the Person screen of the Example prototype which uses a SET datatype in MySQL and an ARRAY datatype in PostgreSQL.
