Subject: detail view header

I'm doing a detail report with parent-child data, for selected parent rows.

It would be nice to have a call to "_cm_DetailView_header()" in PDF::DetailView() that works like _cm_ListView_header().

Or simpler, something like _cm_Report_header() that works in both.

Workaround is simply formatting the first detail line to look like a header.

Suggestions welcome.

Can you give me an example of what you are trying to do? At first guess it sounds like what you want can already be done in a list view with extra data in the header.
