This really is a great way to set up a web application. I have a question regarding searching/filtering data that appear in LIST2 screens. How would you go about creating an "on the fly" search to filter out data from a LIST1 screen to a LIST2 screen? The search you currently have works great, but what if you'd like to search within a range of integer field values or dates, rather than only a specific value.
Also, is there any way you can think of implementing a saved search function that would allow for a way to change the sql_where of a list screen based on values in another table?

Thanks!! I hope these questions make sense.

If you want to enter a range of values as search criteria then take a look at http://www.tonymarston.net/php-mysql/infrastructure-faq.html #faq52. For a working example take a look at http://www.tonymarston.net/php-mysql/menuguide/audit_dtl(sea rch).html

If you want to generate other search criteria then you can put whatever code you like into the _cm_pre_getData() method.
